MEMORANDUM

Date: October 25, 2019

Project #: 22521.001

To: Lily Brown, Oakland DOT
Planning & Project Development, OakDOT Great Streets Division

CC: Patrick Gilster, Toole Design Group

From: Amy Lopez, RSP; Kevin Yost

Project: 14th Street: Safe Routes in the City

Subject: Operations Analysis Memo

Kittelson & Associates, Inc. (Kittelson) conducted a traffic operations study to analyze the build-out of the 14th Street: Safe Routes in the City project (project).

The 14th Street: Safe Routes in the City project extends along 14th Street between Brush Street and Oak Street-Lakeside Drive. The proposed improvements include reducing the number of vehicle lanes to reallocate right-of-way for bicyclists, pedestrians, and transit vehicles. Namely, the project converts 14th Street from a four-lane, two-way undivided street to a two-lane, two-way undivided street. Kittelson performed traffic operations analysis to evaluate the effects of the project to motor vehicles during the weekday AM and PM peak hours.

Kittelson evaluated the intersection delay, volume-to-capacity (v/c) ratios, and queue lengths during weekday AM and PM peak hours to understand how traffic would operate after construction of the project. Kittelson previously conducted a traffic operations study for the 14th Street project in 2016, which analyzed the roadway configuration proposed at that time. The results from that analysis were documented in the memo dated June 2, 2016.

Study Intersections and Methodology

Kittelson analyzed traffic operations for the intersections with the following cross streets:

1. Brush Street
2. Castro Street
3. Clay Street
4. Broadway
5. Franklin Street

6. Webster Street
7. Harrison Street
8. Madison Street
9. Lake Merritt Boulevard & Oak Street-Lakeside Drive

All study intersections are signalized. Signal timing and phasing for each intersection is assumed to have remained the same since 2016. Weekday AM and PM turning movement counts were collected 7:00-9:00 a.m. and 4:00-6:00 p.m. on Wednesday, May 29th, 2019. The counts included motor vehicles, bicyclists, and pedestrians at each intersection. *Appendix A* contains the traffic counts for the study intersections.

A traffic operations analysis was conducted for the weekday AM and PM peak hours. Kittelson used Synchro 10 software package to implement the Highway Capacity Manual (HCM) 2000 Edition methodology—consistent with the 2016 analysis—for calculating the following performance measures:

- Average intersection control delay (delay per vehicle)
- Intersection level of service (LOS)
- Intersection volume-to-capacity (v/c) ratio
- 50th percentile queues by approach

Assumptions within the analysis:

1. The frequency of on-street parking maneuvers is assumed to be the same in the existing and project conditions.
2. Bus service on 14th Street under the project condition will occur at 15-minute headways in the weekday AM and PM peak hours.
3. Buses will stop in the through lane on 14th Street for passenger boarding and alighting.
4. Vehicles will not divert to alternative routes (i.e., the turning movement volumes at each intersection will be the same under existing and project conditions).
5. Signal timing for all study intersections would be updated as part of project implementation to optimize operations for motor vehicles and bicyclists traveling along the corridor while balancing time needed for pedestrians to cross 14th Street and the cross streets.

Results

All study intersections will continue to operate below capacity with the reduction in vehicle lanes. Generally, v/c ratios are expected to be 0.70 or lower in the weekday AM and PM peak hours, indicating approximately 30% or more of unused capacity at the study intersections. Exceptions to

this occur during the AM peak hour at Broadway (v/c of 0.82) and at Harrison Street (v/c of 0.89). Furthermore, with the planned vehicle lane reduction, the level of service for all study intersections is expected to be LOS C or better in the weekday AM and PM peak hours.

Table 1 and Table 2 summarize the v/c ratios, average delay, and LOS for the study intersections during the weekday AM and PM peak hours, respectively.

Appendix B contains the Synchro 10 output worksheets containing additional detail on v/c ratios, intersection delay, and level of service.

Table 1: AM Peak Hour Results - Summary of V/C Ratios, Delay and Level of Service

¹ Project assumes signal phasing optimization.

Queueing

The analysis conducted in 2016 included an evaluation of queue lengths by intersection approach to inform where turn lanes are appropriate. Kittelson updated the queue analysis to confirm where exclusive turn lanes should be provided based on current turning movement volumes and pedestrian crossing volumes. The project now includes exclusive turn lanes at the following locations:

Eastbound left-turn lanes

- Castro Street

Eastbound right-turn lanes

- Brush Street
- Broadway
- Webster Street

Westbound left-turn lanes

- Brush Street

Westbound right-turn lanes

- Castro Street
- Oak Street-Lakeside Drive

Figures 1 through 4 illustrate the 50th percentile queue lengths. A 50th percentile queue represents the average queue length expected for an approach during a peak hour. Along 14th Street, the queue storage capacity for each intersection is considered the distance between the stop bar of a given approach and the near side of the nearest crosswalk at the upstream intersection.

AM Peak Hour. In the AM peak hour, Synchro software analysis of existing traffic volumes estimates 50th percentile queues will be less than the queue storage capacity for all intersections under existing conditions with the exception of Broadway and Madison Street. The 50th percentile queues at these intersections for westbound vehicles are expected to slightly exceed the length of the blocks. Depending on driver behavior, a person could partially block the intersection at Franklin Street or at Oak Street-Lakeside Drive for a few seconds until traffic starts moving. However, it is more likely that a driver would wait at the previous intersection for the next green signal so that the queue along the block can begin to clear. Average queues along 14th Street in the morning peak hour generally are expected to be accommodated within the length of a block without spilling back to an upstream intersection.

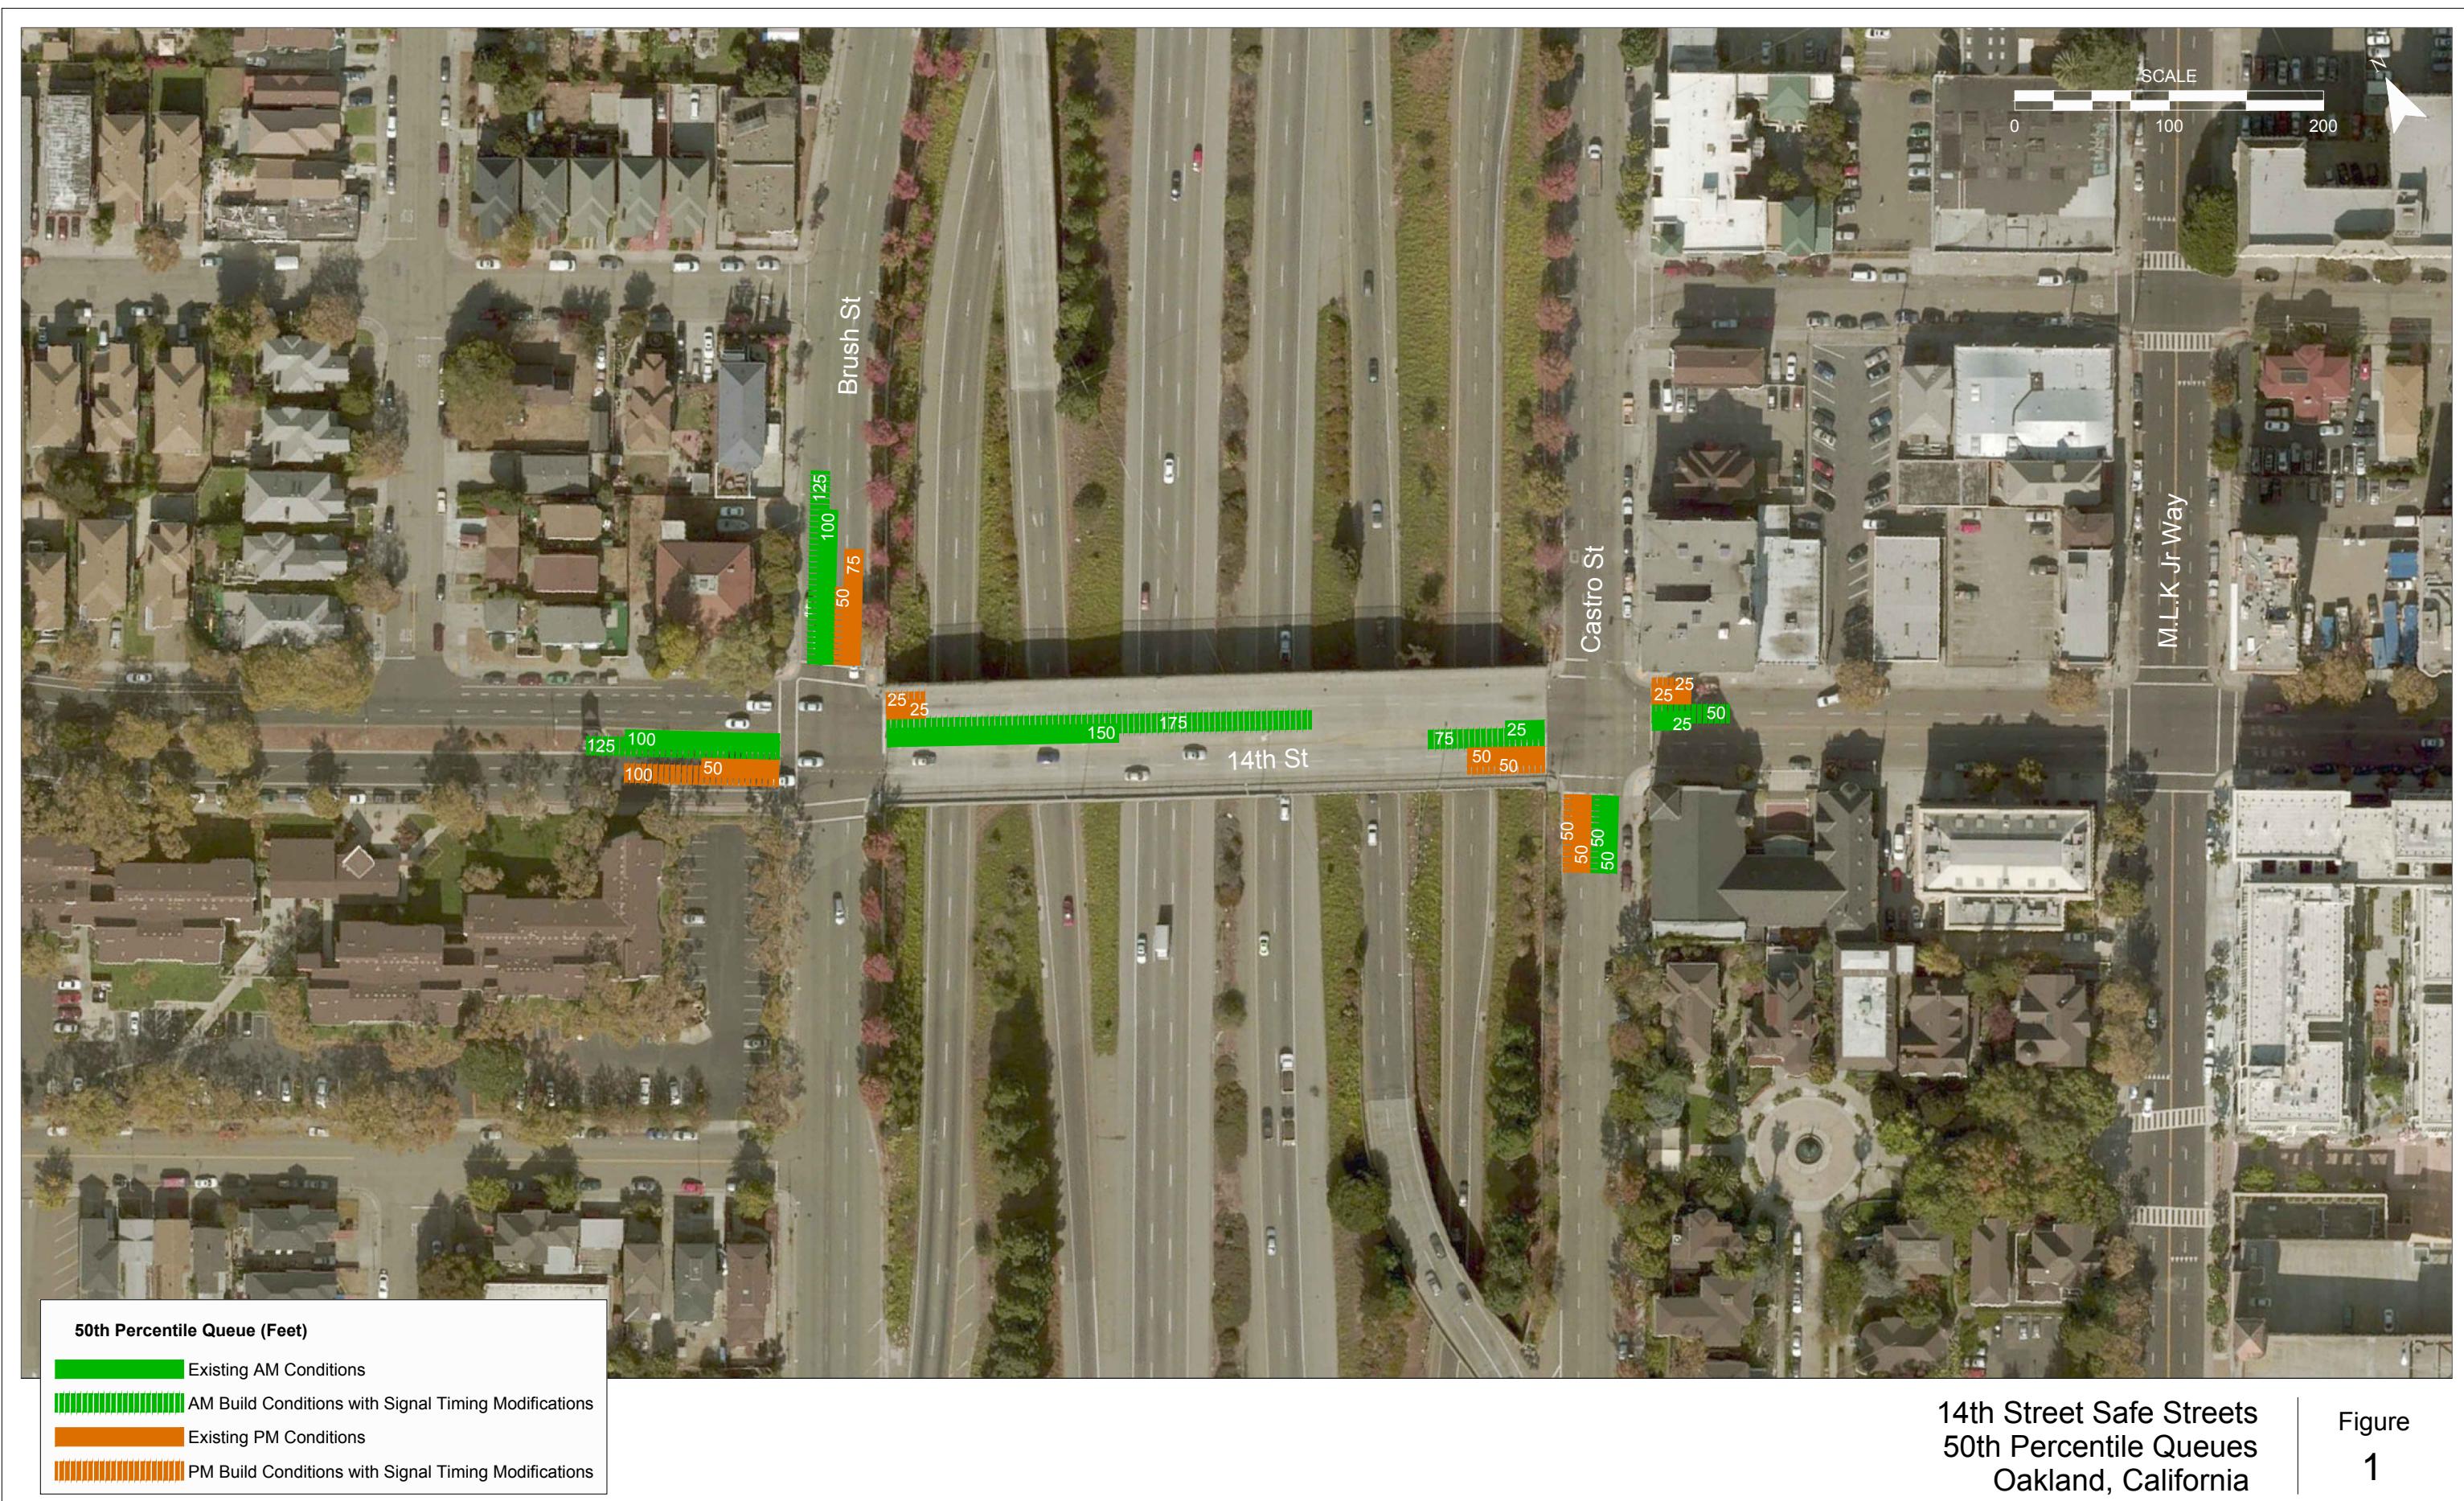

PM Peak Hour. In the PM peak hour, Synchro software analysis of existing traffic volumes estimates 50th percentile queues are less than the queue storage capacity for all intersections under existing conditions. On average, queues along 14th Street during the evening peak hour are expected to be accommodated within the length of a block without spilling back to an upstream intersection.

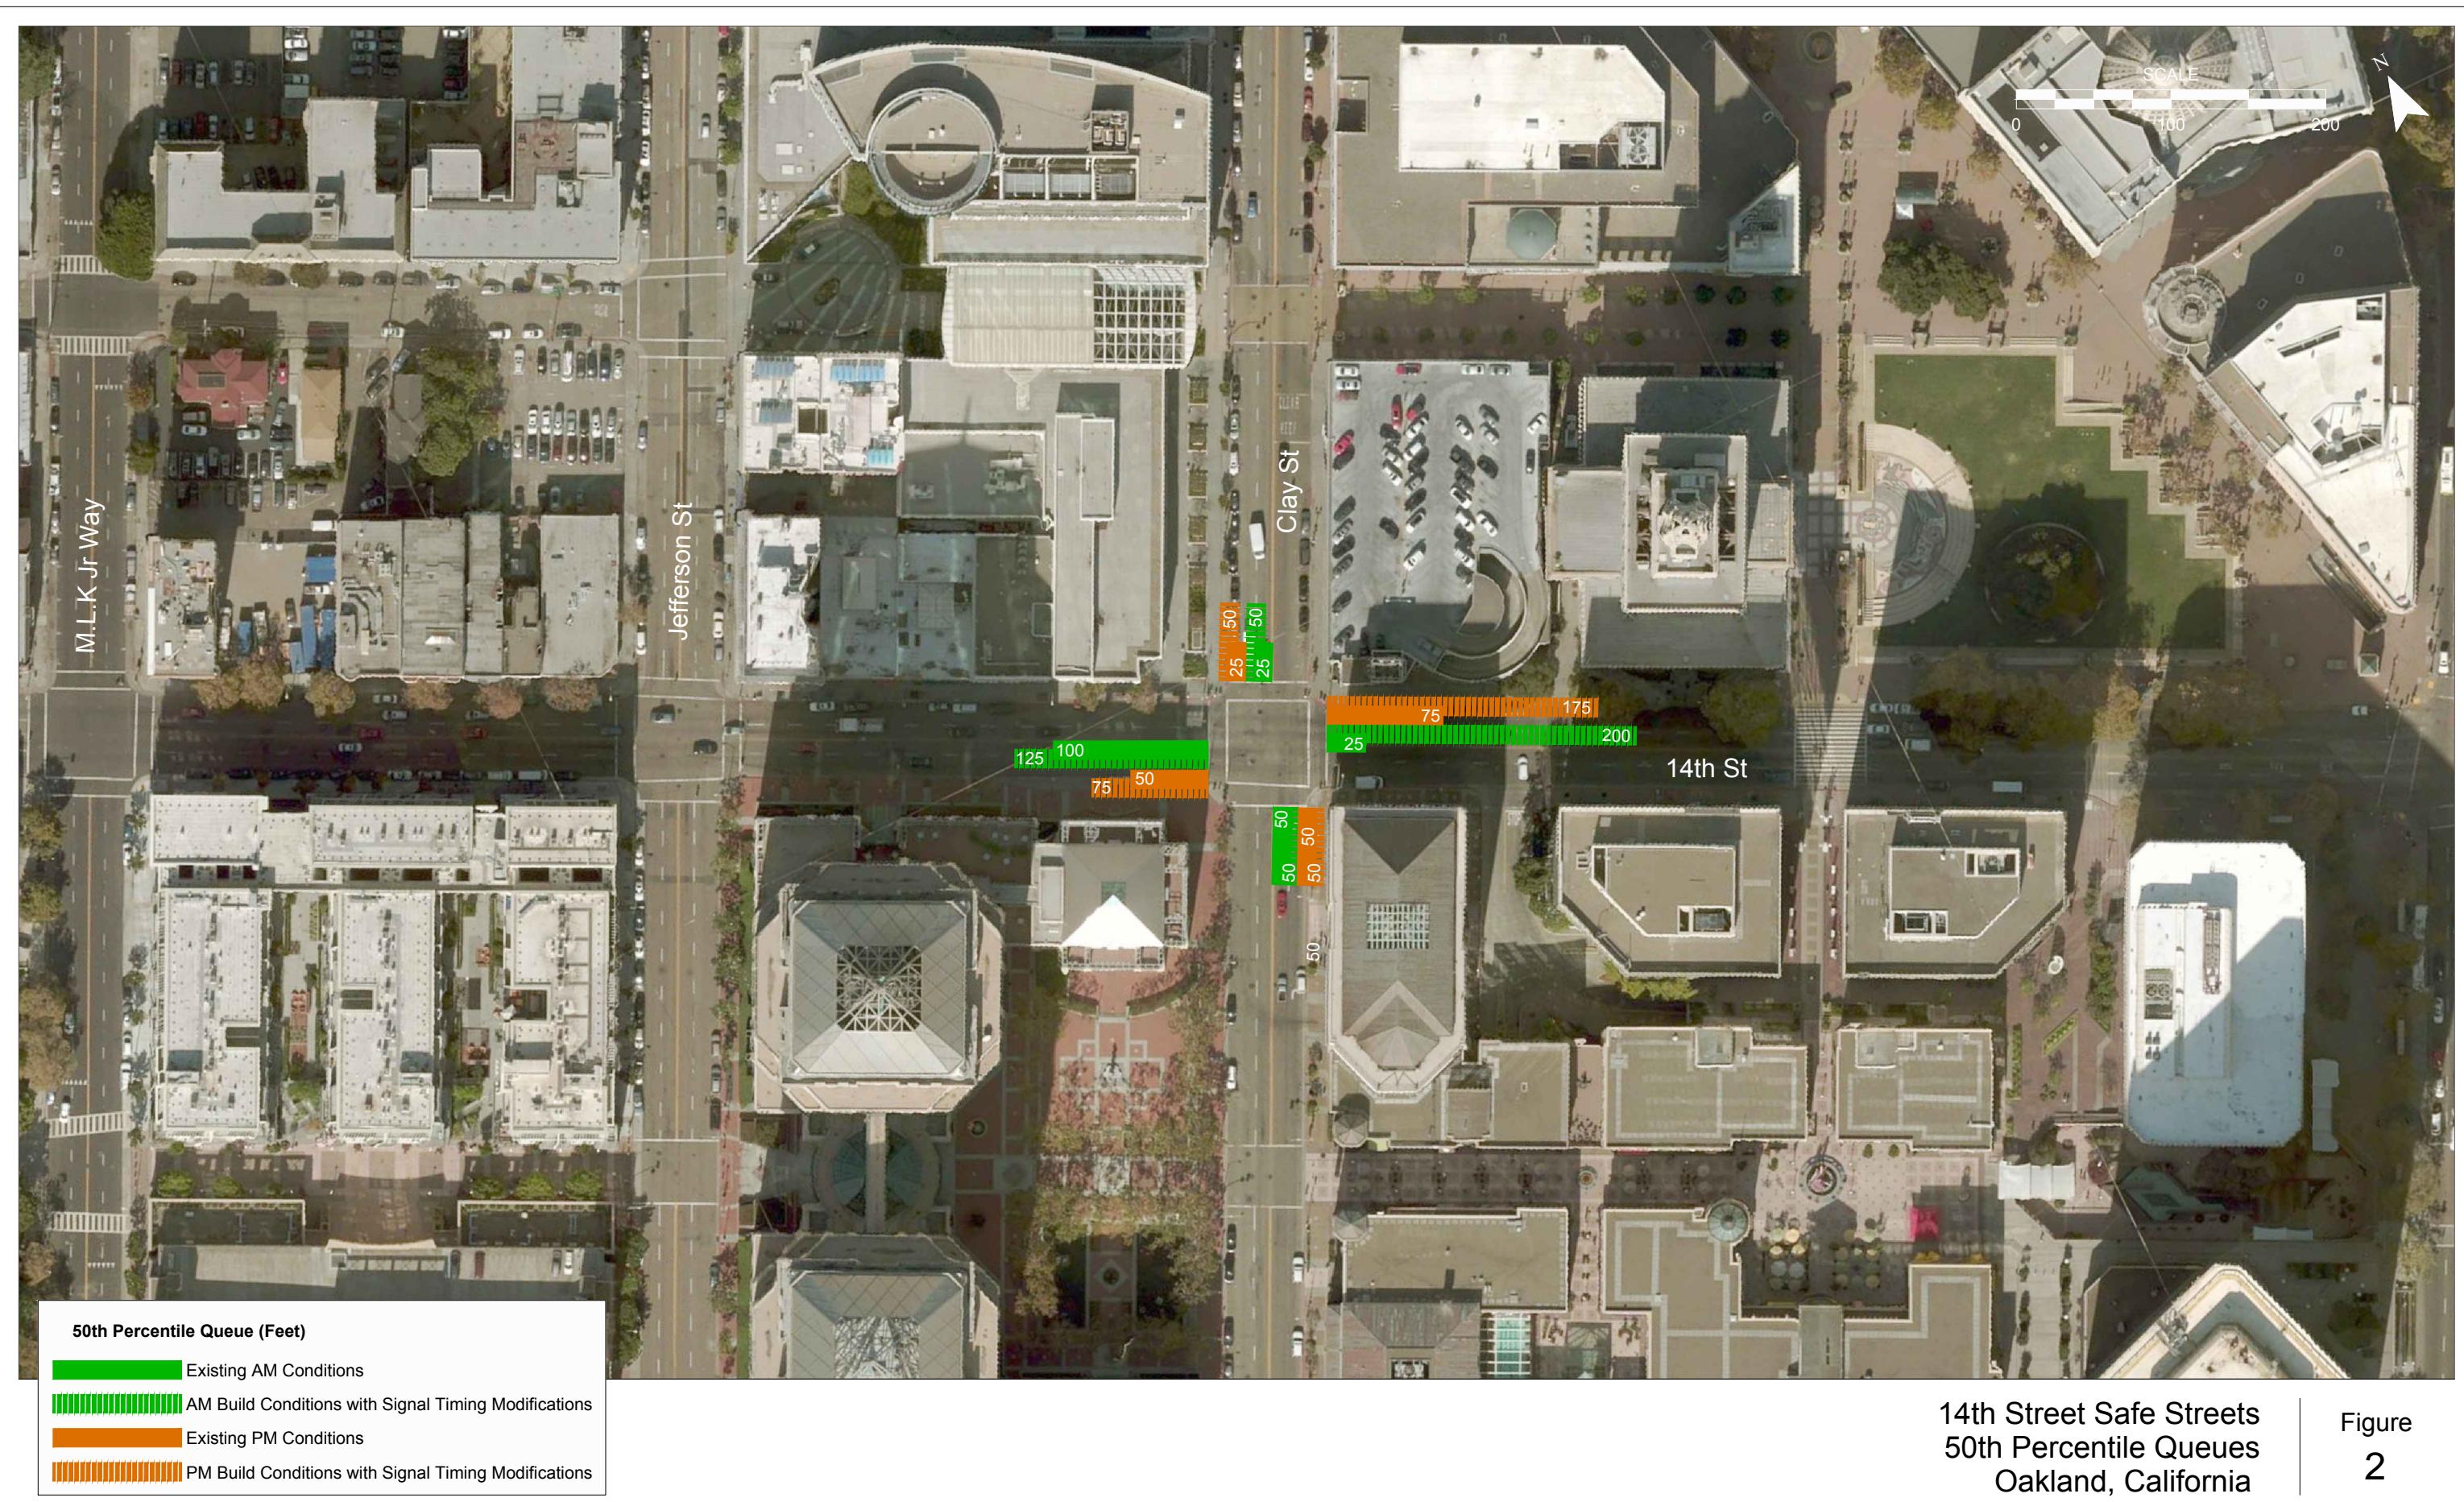

Appendix C contains the Synchro 10 output worksheets containing additional details on 50th percentile queues.

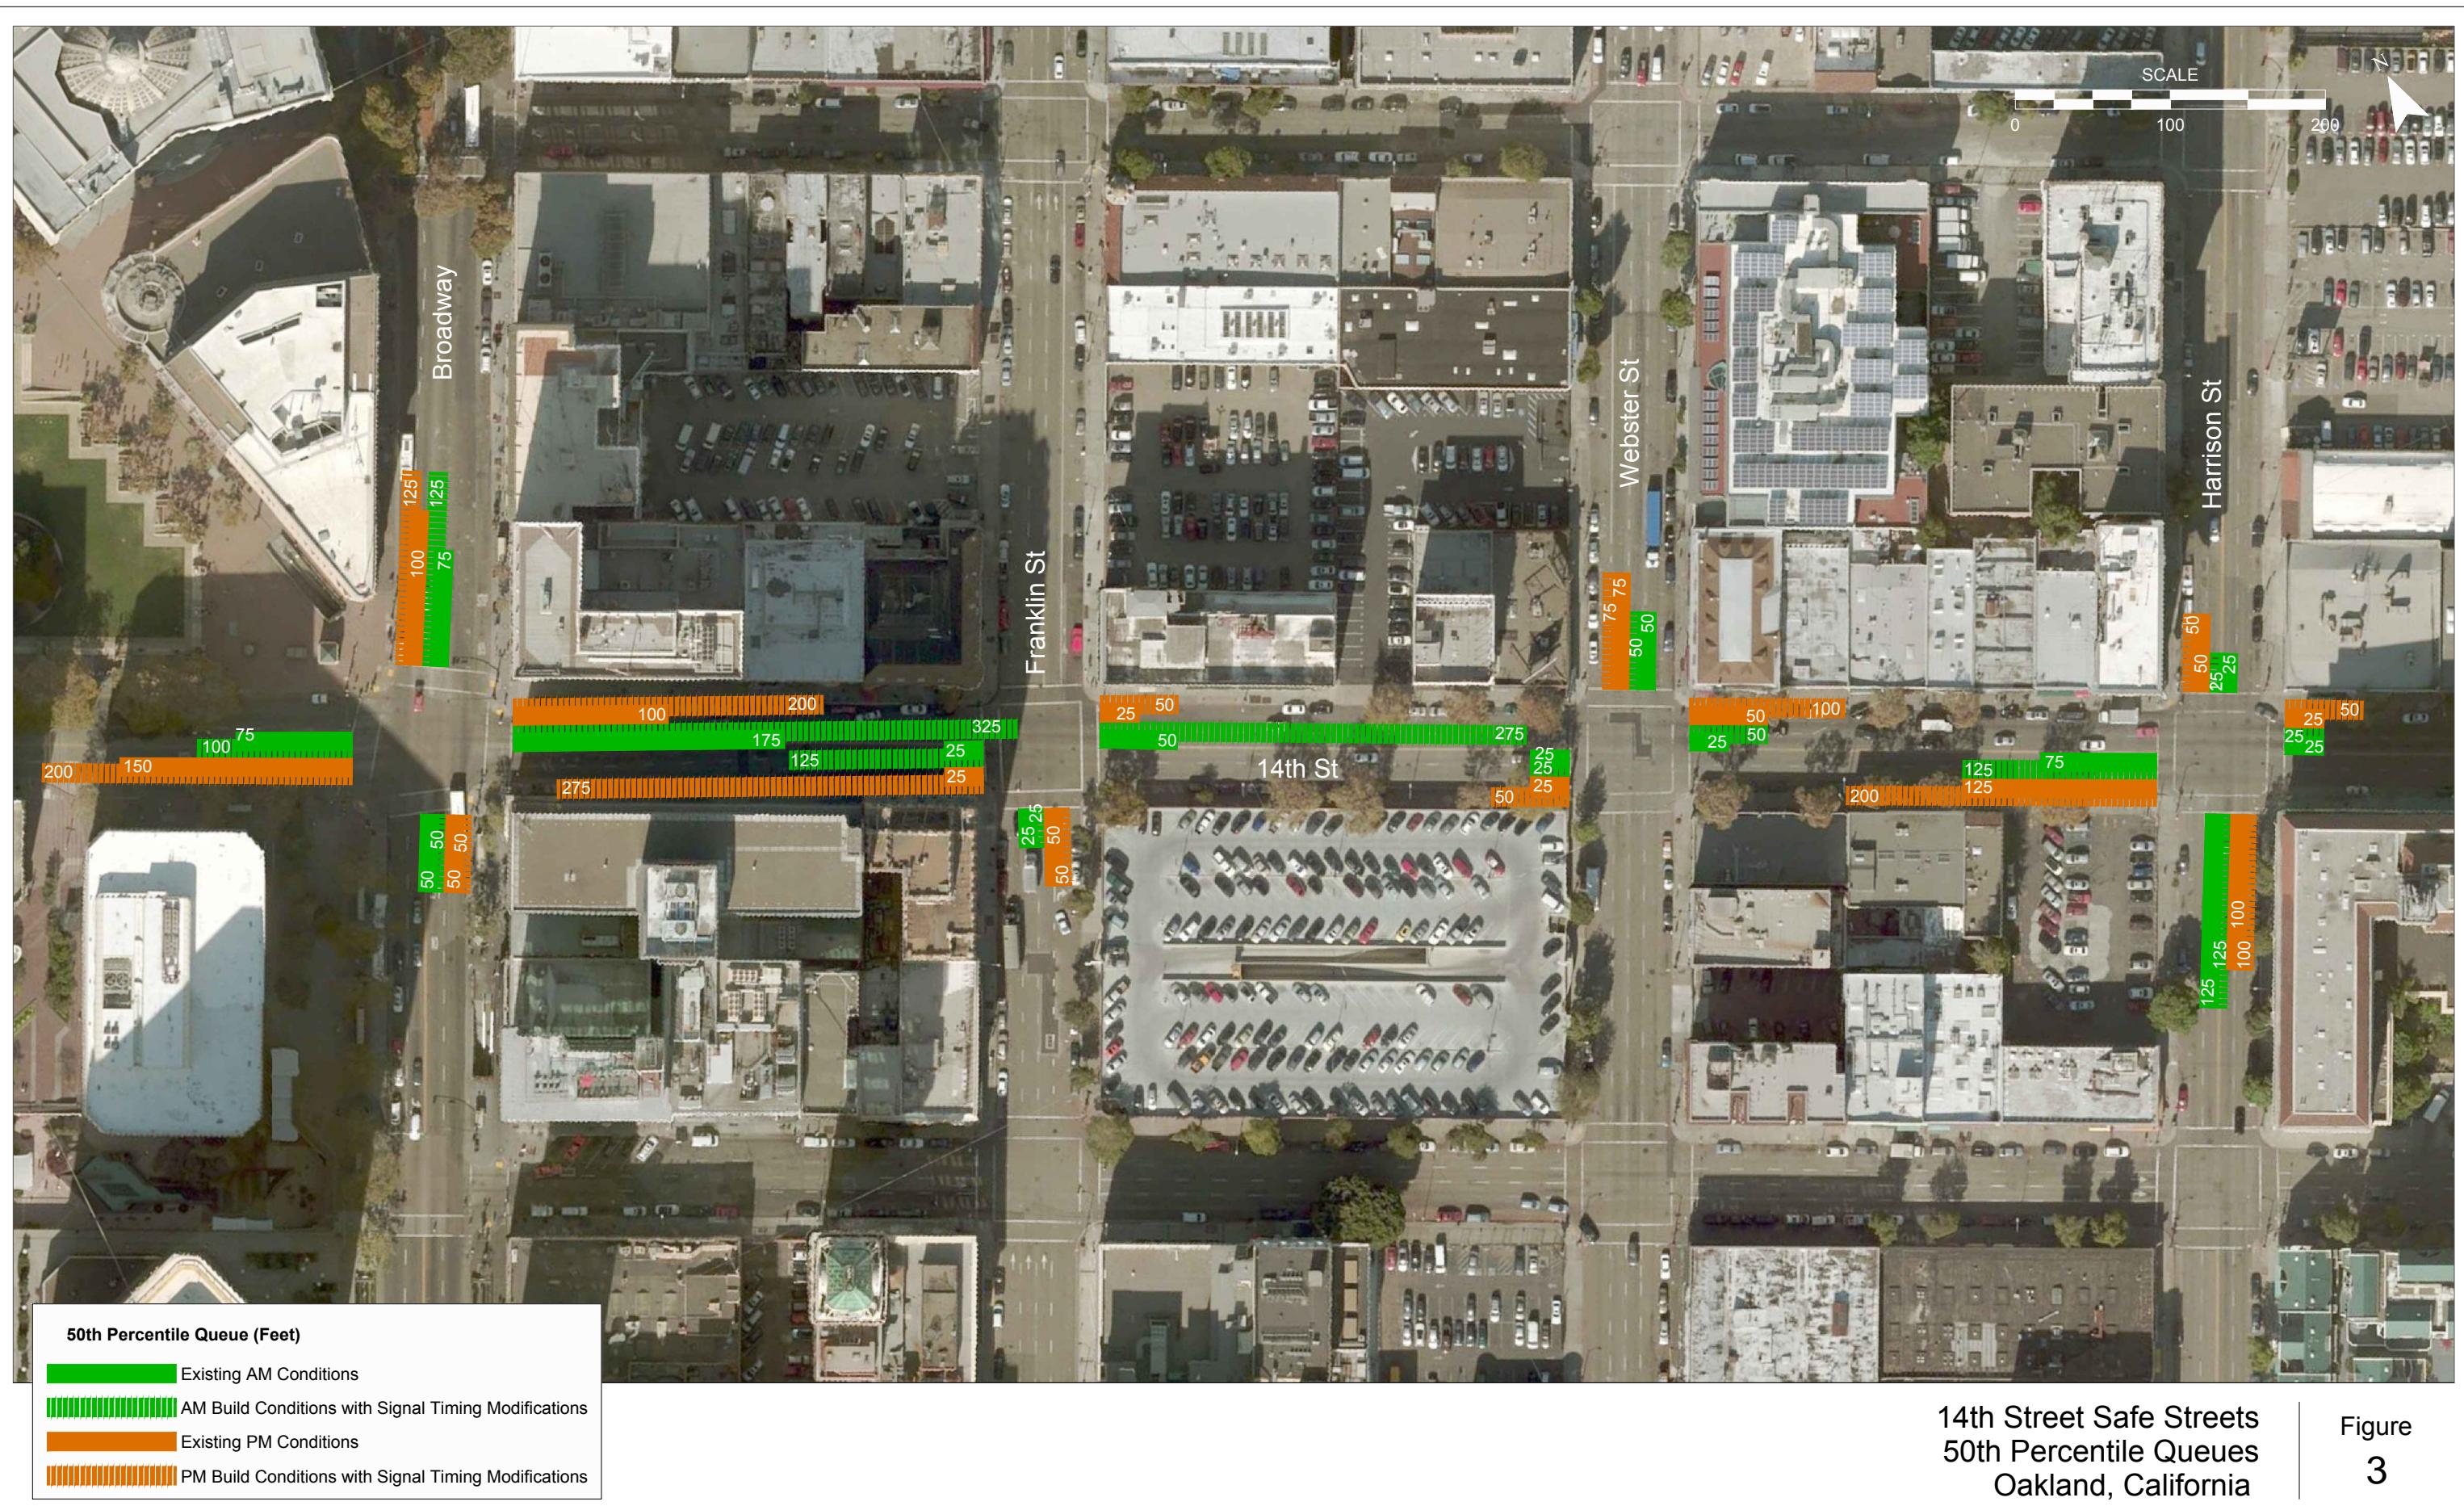

Summary

The results from the operations analysis demonstrate traffic would continue to follow acceptably through the corridor with intersections operating within the city's standards during morning and evening commute periods. The study intersections are expected to operate at LOS C or better during AM and PM peak hours, and traffic volumes would remain within the capacity of the intersections.

Queue lengths at the study intersections are estimated to be less than the available storage capacity under existing conditions. With construction of the project, 50th percentile, or average queues, are expected to remain within available storage capacity when the project is constructed.
